I/O Configuration General Practices

Match Software and Hardware Configuration

The I/O that may be embedded in your controller is independent of the I/O that you may have added in the form of I/O expansion. It is important that the logical I/O configuration within your program matches the physical I/O configuration of your installation. If you add or remove any physical I/O to or from the I/O expansion bus or, depending on the controller reference, to or from the controller (in the form of cartridges), then you must update your application configuration. This is also true for any field bus devices you may have in your installation. Otherwise, there is the potential that the expansion bus or field bus will no longer function while the embedded I/O that may be present in your controller will continue to operate.

WARNING

UNINTENDED EQUIPMENT OPERATION

Update the configuration of your program each time you add or delete any type of I/O expansions on your I/O bus, or you add or delete any devices on your field bus.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

Replacing an Existing Cartridge

To replace an existing cartridge with a difference reference, drag and drop the new cartridge onto the cartridge to be replaced.

A message appears asking you to confirm the operation. Click **Yes** to continue.

Removing a Cartridge

To remove a cartridge from a controller, either click on the cartridge and press the **Delete** key, or right-click on the cartridge and click **Remove** on the contextual menu that appears.

If the cartridge contains at least one address being used in the user logic of the program, a message appears asking you to confirm the operation. Click **Yes** to continue.

Configuring Cartridges

You can configure both physical and protocol settings for the serial line. Serial lines are configured for the Modbus RTU protocol by default.

NOTE: You can only add one serial line cartridge to the controller.

Serial Line Configuration

This table describes how to configure the serial line:

This table describes each parameter of the serial line:

Parameter	Editable	Value	Default Value	Description
Physical settings				
Baud rate	Yes	1200 2400 4800 9600 19200 38400 57600 115200	19200	Allows you to select the data transmission rate (bits per second) for the modem from the drop-down list.
Parity	Yes	None Even Odd	Even	Allows you to select the parity of the transmitted data for error detection. Parity is a method of error detection in transmission. When parity is used with a serial port, an extra data bit is sent with each data character, arranged so that the number of 1 bits in each character, including the parity bit, is always odd or always even. If a byte is received with the wrong number of 1 bits, the byte is corrupt. However, an even number of detected errors can pass the parity check.
Data bits	Yes (only for the ASCII protocol)	7 8	7 for Modbus ASCII, 8 for Modbus RTU	Allows you to select the number of data bits from the drop-down list. The number of data bits in each character can be 7 (for true ASCII) or 8 (for any kind of data, as this matches the size of a byte). 8 data bits are almost universally used in all applications.
Stop bits	Yes	1 2	1	Allows you to select the number of stop bits from the drop-down list. A stop bit is a bit indicating the end of a byte of data. For electronic devices, 1 stop bit is usually used. For slow devices like electromechanical teleprinters, 2 stop bits are used.

Parameter	Editable	Value	Default Value	Description
Physical medium	Yes	RS485 True/False RS232 True/False	RS485 True	Allows you to select the physical medium for communication. You can only select either the RS485 or RS232 medium. Enabling one medium disables the other one. A physical medium in data communications is the transmission path over which a signal propagates. It is an interface for interconnection of devices with the logic controller.
Polarization	Yes	Yes No	No	Polarization resistors are integrated in the cartridge module. Specify whether to switch on or off polarization.
Protocol settings				
Protocol	Yes	Modbus RTU Modbus ASCII ASCII	Modbus RTU	Allows you to select the protocol transmission mode for communication from the drop-down list. Protocol advanced parameters are displayed based on the selected protocol. Refer to the following figures and tables.
Protocol settings for the Modbus RTU and Modbus ASCII protocols:				
Addressing	Yes	Slave Master	Slave	Allows you to select the addressing mode. You can only select either of the Slave or Master addressing. Enabling one addressing mode disables the other one.
Address [1...247]	Yes	1...247	1	Allows you to specify the address ID of the slave. NOTE: This field is displayed only for the addressing of the slave. For master, this field does not appear on the screen.
Response time (x 100 ms)	Yes	10...255 ms	10	Allows you to specify the response time of the protocol to the queries.
Time between frames (ms)	Yes	3...255 ms	10	Allows you to specify the time between frames of the protocol.
Protocol settings for the ASCII protocol:				
Stop condition				
Response time (x 100 ms)	Yes	1...255	10	Allows you to specify the response time of the protocol to the queries.

Parameter	Editable	Value	Default Value	Description
Frame length received	Yes	0...255	0	Allows you to specify the frame length received.
Frame received timeout (ms)	Yes	0...255	10	Allows you to specify the frame received timeout.
Frame structure				
Start character	Yes	0...255	58 (if check box is selected)	Allows you to specify the start character of the frame.
First end character	Yes	0...255	10 (if check box is selected)	Allows you to specify the first end character of the frame.
Second end character	Yes	0...255	10 (if check box is selected)	Allows you to specify the second end character of the frame.
Send frame characters	Yes	True/False	False	Allows you to enable or disable sending first end character of the frame to the ASCII protocol.

TMC2CONV01

Introduction

The TMC2CONV01 is an application cartridge module featuring 1 serial line for conveying. For further hardware information, refer to TMC2CONV01 (*see Modicon TMC2, Cartridges, Hardware Guide*).

The serial line can be configured for any one of the following protocols:

- Modbus RTU
- Modbus ASCII
- ASCII

You can configure both physical and protocol settings for the serial line. Serial lines are configured for the Modbus RTU protocol by default.

NOTE: You can only add one serial line cartridge to the controller.

Serial Line Configuration

This table describes how to configure the serial line:

This table describes each parameter of the serial line:

Parameter	Editable	Value	Default Value	Description
Physical settings				
Baud rate	Yes	1200 2400 4800 9600 19200 38400 57600 115200	19200	Allows you to select the data transmission rate (bits per second) for the modem from the drop-down list.
Parity	Yes	None Even Odd	Even	Allows you to select the parity of the transmitted data for error detection. Parity is a method of error detection in transmission. When parity is used with a serial port, an extra data bit is sent with each data character, arranged so that the number of 1 bits in each character, including the parity bit, is always odd or always even. If a byte is received with the wrong number of 1 bits, the byte is corrupt. However, an even number of detected errors can pass the parity check.
Data bits	Yes (only for the ASCII protocol)	7 8	7 for Modbus ASCII, 8 for Modbus RTU	Allows you to select the number of data bits from the drop-down list. The number of data bits in each character can be 7 (for true ASCII) or 8 (for any kind of data, as this matches the size of a byte). 8 data bits are almost universally used in all applications.
Stop bits	Yes	1 2	1	Allows you to select the number of stop bits from the drop-down list. A stop bit is a bit indicating the end of a byte of data. For electronic devices, 1 stop bit is usually used. For slow devices like electromechanical teleprinters, 2 stop bits are used.

Parameter	Editable	Value	Default Value	Description
Physical medium	Yes	RS485 True/False RS232 True/False	RS485 True	Allows you to select the physical medium for communication. You can only select either the RS485 or RS232 medium. Enabling one medium disables the other one. A physical medium in data communications is the transmission path over which a signal propagates. It is an interface for interconnection of devices with the logic controller.
Polarization	Yes	Yes No	No	Polarization resistors are integrated in the cartridge module. Specify whether to switch on or off polarization.
Protocol settings				
Protocol	Yes	Modbus RTU Modbus ASCII ASCII	Modbus RTU	Allows you to select the protocol transmission mode for communication from the drop-down list. Protocol advanced parameters are displayed based on the selected protocol. Refer to the following figures and tables.
Protocol settings for the Modbus RTU and Modbus ASCII protocols:				
Addressing	Yes	Slave Master	Slave	Allows you to select the addressing mode. You can only select either of the Slave or Master addressing. Enabling one addressing mode disables the other one.
Address [1...247]	Yes	1...247	1	Allows you to specify the address ID of the slave. NOTE: This field is displayed only for the addressing of the slave. For master, this field does not appear on the screen.
Response time (x 100 ms)	Yes	10...255 ms	10	Allows you to specify the response time of the protocol to the queries.
Time between frames (ms)	Yes	3...255 ms	10	Allows you to specify the time between frames of the protocol.

Parameter	Editable	Value	Default Value	Description
Protocol settings for the ASCII protocol:				
Stop condition				
Response time (x 100 ms)	Yes	1...255	10	Allows you to specify the response time of the protocol to the queries.
Frame length received	Yes	0...255	0	Allows you to specify the frame length received.
Frame received timeout (ms)	Yes	0...255	10	Allows you to specify the frame received timeout.
Frame structure				
Start character	Yes	0...255	58 (if check box is selected)	Allows you to specify the start character of the frame.
First end character	Yes	0...255	10 (if check box is selected)	Allows you to specify the first end character of the frame.
Second end character	Yes	0...255	10 (if check box is selected)	Allows you to specify the second end character of the frame.
Send frame characters	Yes	True/False	False	Allows you to enable or disable sending first end character of the frame to the ASCII protocol.

TMC2 Analog Cartridge Diagnostics

TMC2 Analog Cartridge Diagnostics

Introduction

For analog cartridges, the operating status of each I/O channel is given by the objects:

- %IWS0.x0y for input channel *y* of cartridge *x*
- %QWS0.x0y for output channel *y* of cartridge *x*

The real-time values of these objects can be read when in online mode, using either an animation table (*see SoMachine Basic, Operating Guide*) or the application.

Input Channel Status Description

This table describes the possible values of the %IWS input channel status word:

Byte value	Description
0	Normal
1	Data conversion in progress
2	Initialization
3	Input operation setting error or cartridge with no input
4	Undefined
5	Wiring error detected (input voltage/current high limit exceeded).
6	Wiring error detected (input voltage/current low limit exceeded).
7	Non-volatile memory error
8...255	Undefined

Output Channel Status Description

This table describes the possible values of the %QWS output channel status word:

Byte value	Description
0	Normal
1	Undefined
2	Initialization
3	Output operation setting error or cartridge with no output
4	Undefined
5	Undefined
6	Undefined
7	Non-volatile memory error
8...255	Undefined
